

Environmental Compliance

We view sustainability as those actions that create value while maintaining safe and environmentally responsible operations for our stakeholders.

Our operating commitment to environmental compliance sets the expectation to operate responsibly and employ what we believe are best management practices designed to limit potential effects to the environment. We work hard to minimize our environmental footprint, to use natural resources efficiently, and to reduce emissions and spill releases.

Environmental ownership and accountability are key to helping ensure our operations respect the communities in which we operate.

Emissions

In addition to maintaining an emission inventory in accordance with state and federal requirements, we focus on lowering our carbon footprint. Our emission reduction efforts include:

Incorporating **environmental planning** into our collaborative decision-making process

Environmental stewardship training for employees

Use of **low-bleed pneumatic devices**

Monitoring emissions in components such as connectors, pressure relief valves, controllers, and tank thief hatches

Rigorous programs for the identification and **timely repair** of detected leaks and **re-inspection** of repaired components at specified time periods
